

The glass used by Isinglass Designs is  
**HIGH QUALITY, SUSTAINABLE, DURABLE, AND VERSATILE.**

### **Quality**

- Glass products begin with float glass produced in the USA from raw materials that are mined locally, minimizing the carbon footprint.
- Custom-built kilns fuse glass to glass, producing a very durable surface for daily use for commercial or hospitality application. This exacting process yields beautiful, consistent glass that is available in a variety of colors, textures, and thicknesses, perfect for customization.

### **Sustainability**

- Glass products contain a portion of recycled glass and glass products are fully recyclable.
- One of the biggest advantages of glass is that it can be continually and indefinitely recycled, without compromising strength or quality.

### **Durability**

- Glass' non-porous surface doesn't absorb food and germs and it can be safely washed at high temperatures.
- Our glass tabletops are tempered, often referred to as safety glass. Tempered glass is used in a variety of applications due to its safety and strength and is ideal for commercial use.
- Tempered glass is generally about four times stronger than regular, or annealed glass.
- Because of the tempering process, the glass is less sensitive to the environment or to impact. However, if it does break, it tends to fracture into smaller, granular pieces. This makes it a much safer option than annealed glass, which shatters into jagged shards.
- Tempered glass tops offer greater longevity and are a safer option, all without sacrificing style or customization options.

### **Beauty and Versatility**

- Glass has been used by master craftsmen for centuries because of its inherent qualities to reflect, refract and diffuse light unlike any other medium.
- Glass has been a favored medium for centuries and our production processes result in a timeless effect with the benefit of modern advances in durability and variety.
